Mobile Applications Lab

Build on the previous labs to create an MVVM implementation of the code provided in the sample on learnonline.

Download the sample and run it to make sure it works and that you understand how it works. This program binds a list of dog breeds provided in json format (in the DATA folder) to a list item template created in XAML.

Provide a user interface that will present a list of dogs to the user. If they click on any particular breed, they will be presented with more information on that breed. Use x:Bind in your implementation and it should look similar to the picture below (good design not withstanding).
